

Handheld Application Systems

The handheld canister system was designed to meet the demand for a simple and portable application system. The handheld applicator is ideal for remote locations or critical areas where holding gauge is essential and high-production equipment is not available. One canister will fill approximately 15 spike holes, making it the easy solution for small bridges, frogs or switches.

Handheld Application System Benefits

Handheld canisters dispense product by using a manual applicator or cordless system. Both applicators are equipped with a shoulder strap for increased safety. The cordless applicator comes with one rechargeable 14v battery and a battery charger.

As with all WVCO Railroad Division application systems, no harsh VOC containing solvents or foaming agents are required.

Handheld Application Systems

System Features

- Handheld canister systems include strap for comfort and increased safety
- Manual or cordless system to choose from
- Cordless systems comes with rechargeable 14v battery and charger
- Perfect for remote locations or when high-production application systems are not available

The handheld application systems feature an easy-grip handle for controlled application. Just insert a canister into the applicator, pull the trigger and the spike hole is filled.
